Diagrams of Levels of DFD

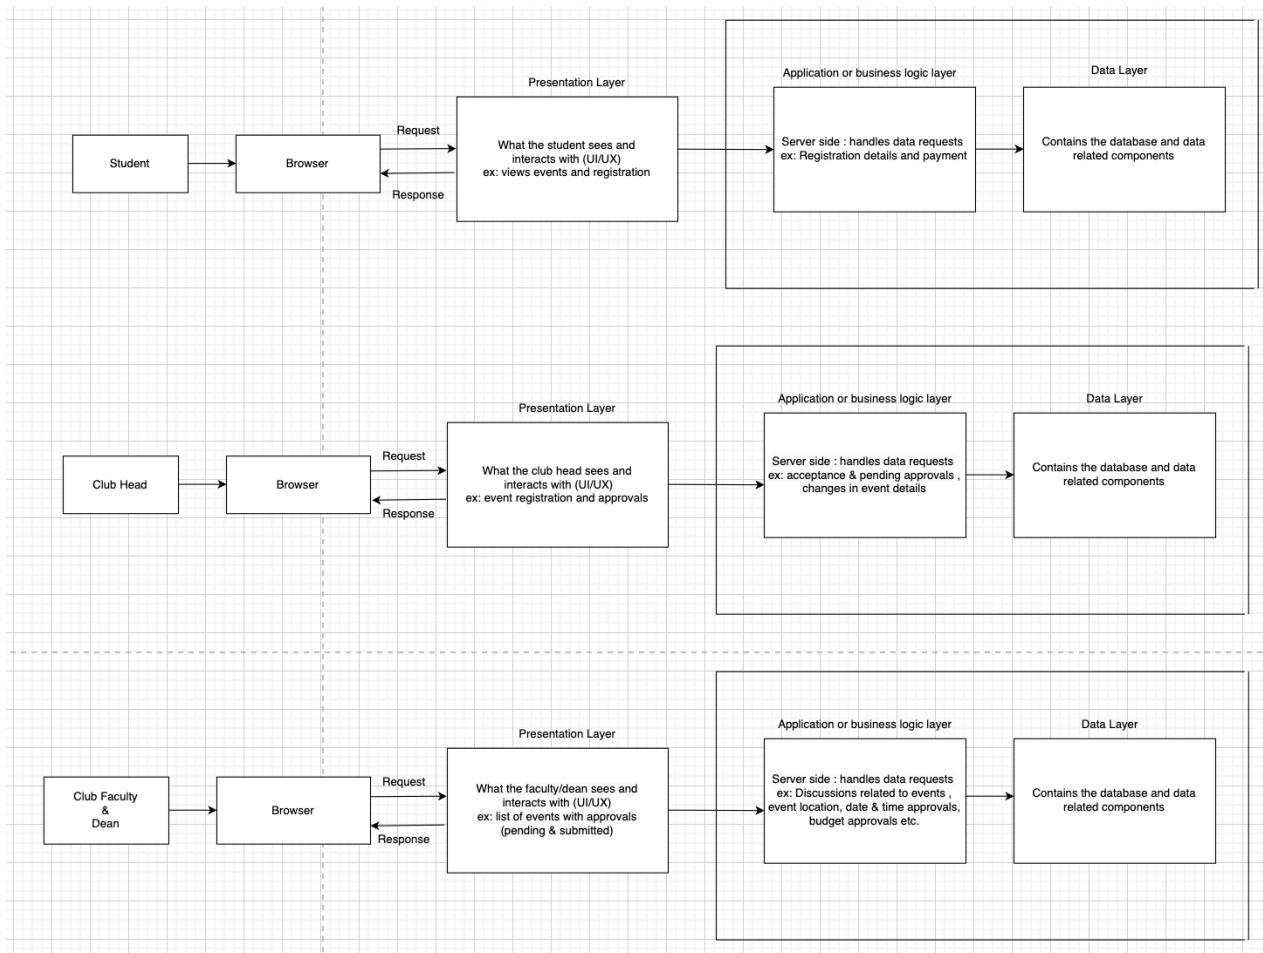

**Level 0 DFD:**

## Level 1 DFD:

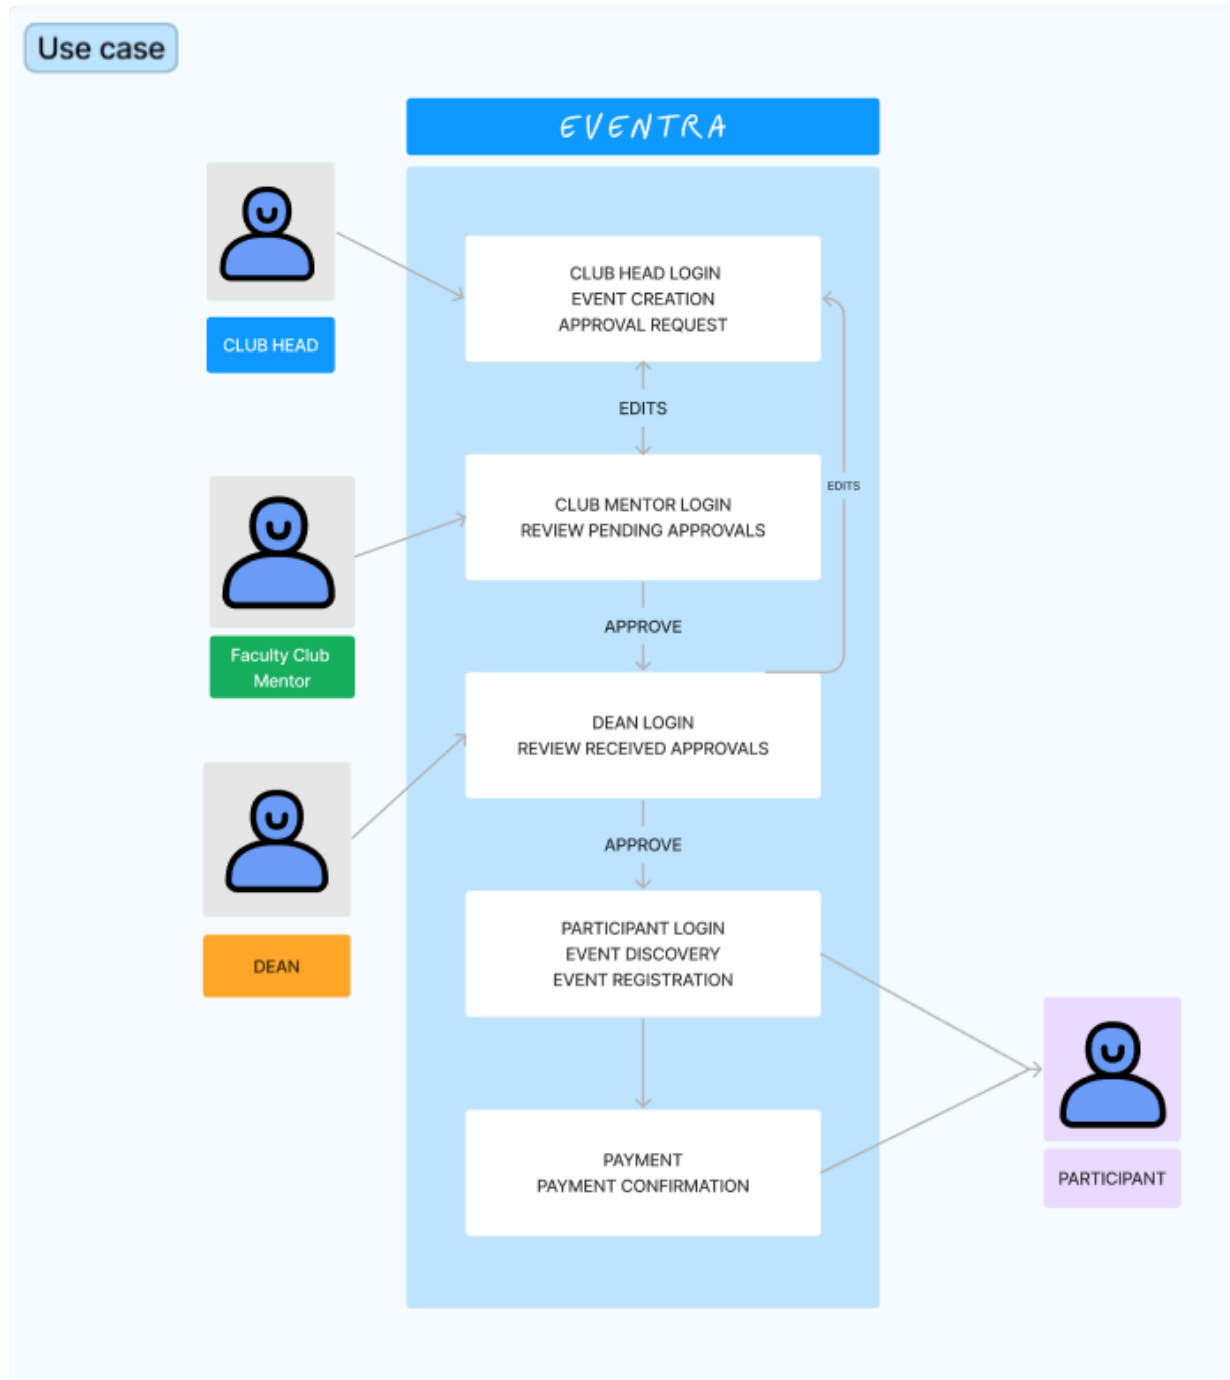

## Architectural Design

A detailed breakdown of what happens at each layer of this architecture:

- The user interacts with the presentation layer. This is the front-end component responsible for rendering the user interface, using **ReactJS** in our case.
- The application layer (also called the business logic layer) handles application logic, business rules, and data access. It includes server runtime (**Node.js**) and web framework (**Express.js**).
- This is where data is stored and retrieved. Our project makes use of a NoSQL database (**MongoDB**).
